1. Event:

Potential Tropical Cyclone Nine (Helene)

2. Event Details:

- The disturbance is forecast to intensify and be near hurricane strength when it reaches the far northwestern Caribbean Sea Tuesday night. Tropical storm conditions are expected over

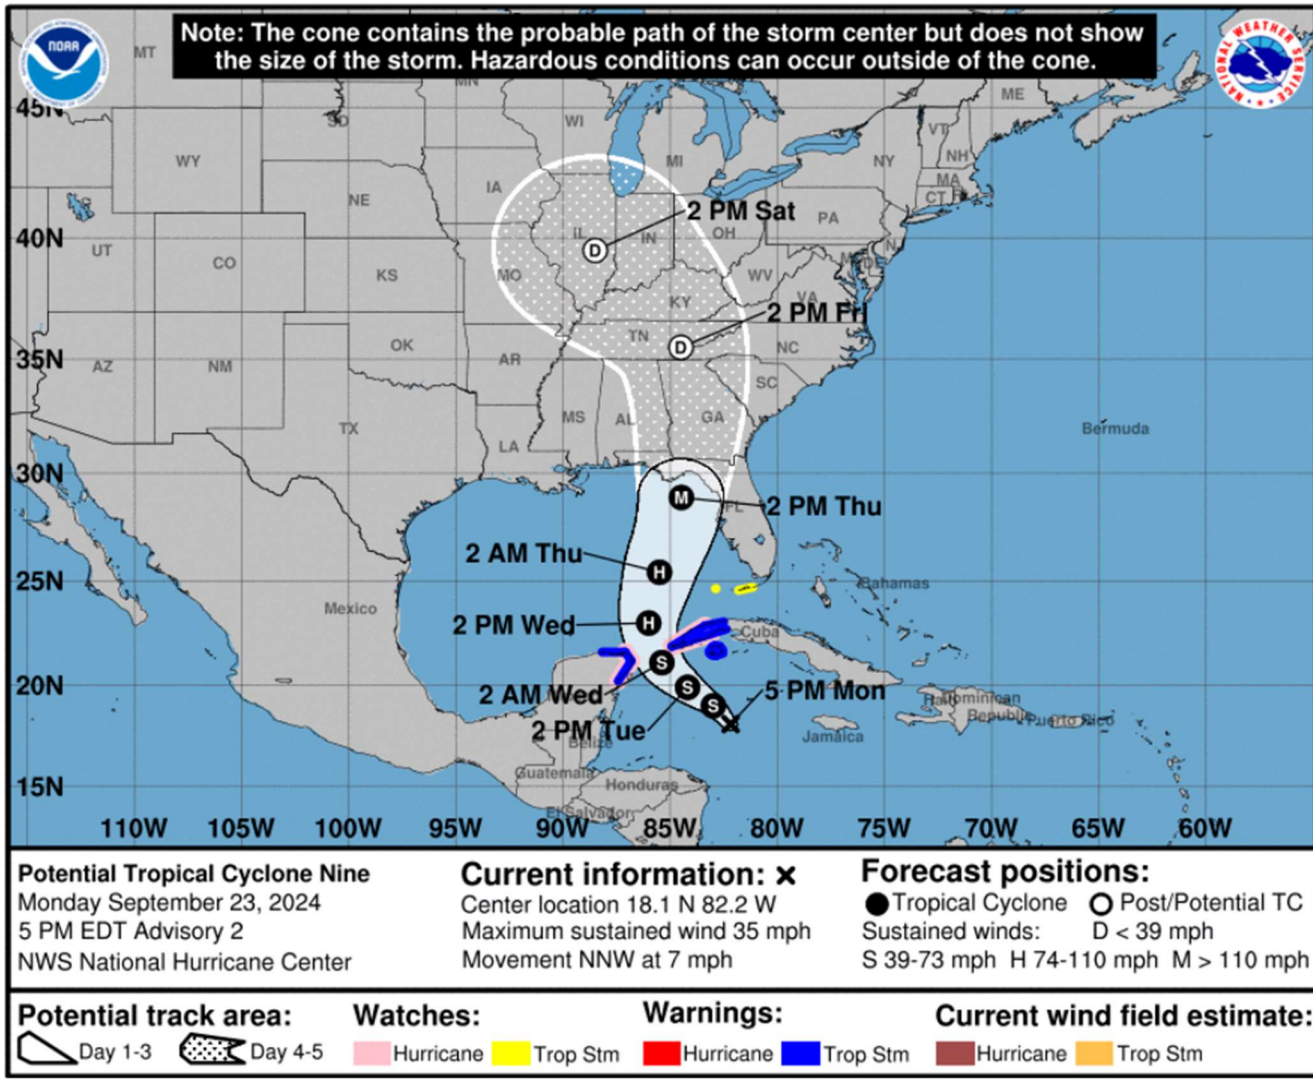

portions of western Cuba and the northeastern coast of the Yucatan Peninsula with hurricane conditions possible.

- The system is expected to intensify into a Major Hurricane before it approaches the northeastern Gulf Coast on Thursday. The potential for life-threatening storm surge and damaging hurricane-force winds along the coast of the Florida Panhandle and the Florida west coast is increasing.
- Note that the system is expected to grow in size while it traverses the Gulf. Thus, the storm surge, wind, and rainfall impacts will extend well away from the center, particularly to the east of the system. In addition, the fast forward speed as it approaches the coast will likely result in farther inland penetration of gusty winds over parts of the southeastern United States after landfall.

3. Moratorium Duration:

- This moratorium will remain in place until further notice.
